

SCAM SCHOOL

Meggie Raaphorst and Sandra Wandel
Hackathon 1
SDG 4 – Quality Education

“For our first hackathon, we created Scam School, an interactive learning application that teaches young people how to recognize common online scams.”

THE PROBLEM

Online scams increasingly look like normal digital interactions.

Target audience: 16–25 who regularly use social media, messaging apps, email and online shopping.

How do you know what to trust?

OUR SOLUTION

- REALISTIC SCENARIO → SCAM OR SAFE? → WARNING SIGNS → FEEDBACK → SCORE
- 6 realistic scenarios
- 4 scams + 2 safe situations
- Immediate educational feedback
- Final score

LIVE DEMO

- Can you spot the scam?

BRIEFING

SPOT THE SCAM

You'll see 6 real-life online situations. Decide if each one is a scam or safe and learn which signals you should look out for.

AI BUILDING PROCES

- Tool: loveble
- **1. Plan**
Defined the user, problem, scenarios and visual style.
- **2. Prompt**
Used a detailed prompt to generate the first working version.
- **3. Test**
Tested the complete user flow.
- **4. Iterate**
Improved layout, feedback, colors and scenario images.

ETHICS & SDG

SDG 4 – Quality Education

Scam School improves digital literacy by teaching young people how to recognize online scams.

- **Ethical considerations**
- Requires internet access and a digital device
- Scams constantly evolve
- The app should not create false confidence
- Examples focus on recognizing scams, not creating them

WHAT WE LEARNED

- **AI needs clear instructions.**
Small ambiguities can completely change an interaction.
- **A working product still needs human decisions.**
We had to define the learning flow, content, visuals and feedback ourselves.
- **Test early, improve step by step.**
A first AI-generated version is a starting point, not the finished product.

**SAME INTERNET.
BETTER DECISIONS.**
