

FlowCheck

An AI-powered daily well-being check for students

n8n workflow

SDG 3

12:00 daily trigger

Good Health & Well-being

The problem

Busy study days can hide workload pressure.

Many students still experience stress, performance pressure and mental health problems.

56%

experienced high or very high stress related to their studies

Design challenge

Support reflection without adding another daily task to an already busy routine.

FlowCheck focuses on workload visibility and small recovery actions.

Source: RIVM, Trimbos Institute & GGD GHOR Nederland, 2023

Target user

Specific enough to design for, limited enough to be safe.

Higher education students (18–25)

- Experience busy or stressful study days
- Have multiple classes, deadlines and commitments
- Want more awareness of daily workload
- Could benefit from a small reminder to slow down

Not intended for

- Diagnosing or treating mental-health conditions
- Professional or urgent mental-health support
- Measuring stress, sleep, anxiety or burnout

The product supports awareness, it does not make health decisions.

Our solution

n8n does the work in the background.

FlowCheck automatically looks at a student's daily calendar and sent-email activity to understand detected schedule load. AI then creates a short, practical well-being suggestion.

No manual mood tracking needed — FlowCheck works with information already available in the student's daily routine.

What does FlowCheck do?

Daily automation, not another survey.

01

Collects context

Calendar events and sent-email activity are retrieved automatically.

03

Classifies schedule load

n8n labels the detected workload as low, moderate or high.

02

Calculates indicators

Python nodes estimate scheduled hours, day span, short gaps and activity.

04

Sends feedback

AI creates two short suggestions and Outlook sends the message.

How does FlowCheck work?

The final prototype is an actual n8n workflow.

Built in n8n • 10+ connected nodes • AI-powered • Automatically triggered at 12:00 PM

Prototype in action

From calendar context to a daily email.

Calendar input

11 AM	
	☒ Lecture - AI for Good
12 PM	
1 PM	☒ Project Meeting - FlowCheck
2 PM	
3 PM	☒ Study Session - Exam Preparation
4 PM	☒ Exam - Python Fundamentals
5 PM	
6 PM	

Daily summary email

FlowCheck - Daily Well-being Summary

Hi,

Here is your FlowCheck summary for today.

Schedule load: low

Scheduled hours: 4

Calendar events: 4

Sent emails so far today: 1

Suggestions for the rest of today:

- Keep some of your free time later today available for a proper break.
- Set a clear stopping point after your final scheduled activity.

FlowCheck uses calendar and email activity as workload indicators only.
It does not diagnose stress or mental health conditions.

How did we build it?

We built FlowCheck step by step in n8n, while using ChatGPT to help us understand problems and create parts of the workflow.

1. Concept

We defined the idea and decided what FlowCheck should do

2. Prompting ChatGPT

We explained what we wanted to achieve and asked for help with specific steps and code

3. Building in n8n

Learned that privacy, reliability and human responsibility must remain central.

4. Testing & improving

We tested the nodes, fixed errors and adjusted the workflow until the complete flow worked

You are FlowCheck, a student well-being assistant.

Your task is to generate exactly 2 short, practical well-being suggestions for the remainder of today using ONLY the workload indicators provided.

The indicators describe calendar activity and sent-email activity. They do NOT measure the student's actual mental state.

IMPORTANT RULES:

- Give exactly 2 suggestions.
- Output only the 2 bullet points.
- Do not add a heading, introduction, conclusion, or summary.
- Do NOT repeat the workload level, scheduled hours, calendar events, day span, short gaps, email count, or workload reasons.
- Do NOT start with phrases such as "Detected schedule load", "Your schedule load is...", or "Today includes..."

Why FlowCheck?

A small intervention that stays realistic.

Automatic

No need to manually track mood after a long study day.

Personalised

AI adapts the suggestion to the detected schedule load.

Privacy-conscious

Raw email content and calendar titles are not sent to the AI.

The goal is not to judge the student. The goal is to make hidden workload patterns visible and suggest a small recovery action.

Ethics & limitations

Health-related automation needs clear boundaries.

PRIVACY

Calendar and message metadata can still be sensitive.

We reduce data to workload indicators before AI sees it.

AI CAN BE WRONG

A busy calendar does not prove stress or poor well-being.

Feedback is framed as a suggestion, not a fact or diagnosis.

NOT PROFESSIONAL CARE

FlowCheck should not be used for serious or urgent mental-health situations.

The tool supports reflection; humans remain responsible.

Automation should stop at general well-being support. It should not make health decisions.

Conclusion & what we learned

A working automation can support well-being with limits.

Automation

Built a real n8n workflow with triggers, connected nodes, processing and output.

AI

Used contextual indicators to generate personalised but bounded suggestions.

AI for Good

Learned that privacy, reliability and human responsibility must remain central.

Technology can support well-being, but it should never replace human judgement.
